Summary

Software Engineer with 5 years of experience building and operating production backend systems across legal-tech SaaS, B2B gaming, and CRM products. Go is the primary language, with hands-on ownership of REST/gRPC APIs, event-driven workflows, PostgreSQL, Redis, Temporal, Docker/Kubernetes, and cloud infrastructure on AWS/GCP. Experienced in modernizing legacy services from TypeScript, .NET/C#, and Perl to Go, and in taking features from design through production monitoring and incident response.

Skills

Languages: Go (primary), JavaScript / TypeScript, SQL

Backend: REST, gRPC/Protobuf, Temporal, Kafka, RabbitMQ, WebSocket, JWT/OAuth2

Databases: PostgreSQL, Redis, MongoDB, ArangoDB

Cloud & Infra: Docker, Kubernetes, AWS (EC2, S3, EKS), GCP (GKE), Helm, ArgoCD

CI/CD & Observability: Jenkins, GitHub Actions, Jaeger, Prometheus, Loki, VictoriaMetrics

Engineering Tooling: Claude Code / OpenCode, GitHub Copilot, Anthropic API

Experience

Legal-Tech SaaS Startup, US (Remote)

Software Engineer (Independent Contractor) — Jan 2026 - Present

- Own end-to-end features across 5+ Go/TypeScript services for a legal-document platform producing demand letters, medical chronologies, and exhibits for personal injury firms.
- Root-caused a multi-hour hang in a production Temporal workflow by reproducing it with a synthetic 17k-page workload; identified a missing activity heartbeat timeout, added failure detection, and converted memory-heavy pipeline stages to streaming I/O.
- Migrated provider API endpoints from TypeScript to Go, preserving integration contracts while improving maintainability and testing; resolved findings from an external code review before rollout.
- Built cross-service cost and timing telemetry through six REST endpoints across two document-processing providers, using a non-fatal reporting path so observability failures cannot block the core workflow.
- Fixed a production defect that silently omitted a required exhibit from generated documents by tracing data ownership across three services and correcting the workflow contract rather than patching the final output.
- Caught a document orientation feature failing on all test inputs before merge; reproduced the issue, documented the evidence, and kept the change out of production until it was corrected.

Mercury Studio, HCMC, Vietnam

Software Engineer - Slotty (B2B gaming backend, 120+ Go microservices) — Jan 2025 - Present

- Migrated .NET/C# services to idiomatic Go across Edge, Integration, and Core layers; delivered CRUD, audit logging, and strict downline authorization for a three-tier person hierarchy.
- Added Jaeger tracing and Redis Cluster caching to hot read paths, reducing repeated downstream gRPC calls; maintained Jenkins, ArgoCD, and Helm delivery across development, staging, and production.
- Built MyTools, an internal Go/React dashboard that replaced manual PostgreSQL and Redis lookups, reducing a common support workflow from about five minutes to five seconds and gaining team-wide adoption.

GTG Software, HCMC, Vietnam

Software Engineer — Jan 2022 - Dec 2024

- Designed and built the real-time messaging core of a CRM platform in Go using gRPC, WebSocket, MongoDB, and OAuth2/Keycloak; deployed to AWS EKS and GCP GKE with VictoriaMetrics, Loki, and Jaeger observability.
- Rewrote a legacy Perl messaging service in Go for the Tokeet property-management platform, adding multi-channel conversation tracking and OAuth2 integrations behind a consistent service layer.
- Built Go/PostgreSQL microservices and Kafka-based idempotent processing for asynchronous workflows; contributed shared coding standards for the microservice layer.
- Built a k3s GitOps and observability stack with ArgoCD, Prometheus/Grafana, Jaeger, and Loki; the team adopted it for internal CI/CD workflows.

Education & Certifications

- **AWS Certified Solutions Architect - Associate** (Credly) - April 2025
- **B.Sc. Computer Science**, Ton Duc Thang University - 2021 · English B1+ · Vietnamese Native
