Summary

Software Engineer with 4+ years of backend experience designing, operating, and owning event-driven microservices end-to-end — architecture through production monitoring and incident response — across B2B gaming, legal-tech SaaS, and CRM products. Hands-on with REST/gRPC APIs, Kafka event streams, relational databases, Docker/Kubernetes, and cloud-native deployment on AWS/GCP. Primary language is Go; track record of picking up new backend stacks fast (migrated a .NET/C# codebase and rewrote a legacy Perl system, both to Go). AWS Certified Solutions Architect – Associate.

Skills

Languages: Go (primary), Java, JavaScript / TypeScript, SQL

Backend: Spring Boot, REST, gRPC, Protobuf, Kafka, RabbitMQ, event-driven microservices, JWT, OAuth2, Temporal

Databases: PostgreSQL, Redis, MongoDB, ArangoDB

Cloud & Infra: Docker, Kubernetes, AWS (EC2, S3, EKS), GCP (GKE), Railway

CI/CD & Obs.: Jenkins, ArgoCD, GitHub Actions, Helm, Jaeger, Prometheus

AI Tooling: Claude Code / OpenCode (daily driver), Claude API (Anthropic SDK, structured output)

Experience

Legal-Tech SaaS Startup (US, Remote)

Software Engineer — Jan 2026 – Present

- Own end-to-end feature delivery across a 5+ service Go/TypeScript microservice architecture for an AI-powered legal-document-automation platform (demand letters, medical-record extraction, exhibit generation) for personal injury law firms.
- Root-caused a multi-hour hang in a production Temporal workflow by building a synthetic 17k-page load test to reproduce it — found the real defect was a missing activity heartbeat timeout letting a dead worker's task go undetected indefinitely (a reported OOM crash was a red herring); added heartbeat timeouts and converted several pipeline stages to streaming I/O.
- Rewrote a 25-endpoint healthcare-provider lookup service from Python to Go end-to-end (auth middleware, connection pooling, background job processing with startup-time recovery, structured logging), delivered over 4 months with a fully-resolved external code review.
- Built a cross-service telemetry pipeline (6 new REST endpoints) recording per-document processing cost/timing across two upstream providers, with a non-fatal write path so a reporting-service outage never blocks the core pipeline.
- Use AI coding agents (Claude Code / OpenCode) daily, verifying against deployed code/git history over trusting stale docs.
- Built and tested a Java/Spring Boot payment-processing service (Kafka producer/idempotent consumer, optimistic locking, Testcontainers integration tests, CI on GitHub Actions) as a self-directed project to deepen Java proficiency alongside this role.

Mercury Studio, HCMC, Vietnam

Software Engineer — Slotty (B2B gaming backend, 120+ Go microservices) — Jan 2025 – Dec 2025

- Instrumented services with Jaeger tracing and Redis Cluster caching, cutting repeated downstream gRPC calls on hot read paths; maintained Jenkins/ArgoCD/Helm CI-CD across dev, staging, and production.
- Migrated .NET/C# backend services to idiomatic Go across Edge, Integration, and Core layers; delivered full CRUD and audit logging for a 3-tier person hierarchy with strict downline permission checks.

GTG Software, HCMC, Vietnam

Software Engineer — Jan 2022 – Dec 2024

- Owned a production Java service integrating Chargebee (billing) to create and track user credits (MongoDB) during onboarding, before transitioning onto the team's primary Go stack.
- Architected the real-time messaging core of a HubSpot-alternative CRM from scratch (Go, gRPC, WebSocket, MongoDB, OAuth2/Keycloak), deployed across AWS EKS and GCP GKE in parallel with full observability (VictoriaMetrics, Loki, Jaeger); established team-wide coding standards for the microservice layer.
- Re-wrote a legacy Perl messaging system in Go, adding multi-channel conversation tracking and OAuth2 cloud integrations (Tokenet).
- Personally built and still maintain a self-hosted k3s homelab with a full GitOps/observability stack (ArgoCD, Prometheus/Grafana, Jaeger/Loki) — the team adopted it as their internal CI/CD backbone, eliminating manual release steps.
- Built Go/PostgreSQL microservices with Kafka-based idempotent async processing.

Education & Certifications

- **AWS Certified Solutions Architect – Associate** ([Credly](https://www.credly.com/certifications/toanngo-aws-solutions-architect-associate)) — April 2025
- **B.Sc. Computer Science** · Ton Duc Thang University — 2021 · English B1+ | Vietnamese Native
